

DAY 2 OF 7

Learn the Handful of Commands You'll Actually Use

Git has hundreds of commands, but working developers really only use about 8–10 of them day to day. You don't need to memorize a manual — you need to get comfortable typing the same handful of commands until they're muscle memory.

DAY 2 OF 7

Learn the Handful of Commands You'll Actually Use

★ WHY THIS MATTERS

Git has hundreds of commands, but working developers really only use about 8–10 of them day to day. You don't need to memorize a manual — you need to get comfortable typing the same handful of commands until they're muscle memory.

WHAT YOU'LL DO

- Learn what a "repository," "commit," and "staging area" actually mean (in plain English, not textbook definitions)
- Practice the core loop: `git init`, `git add`, `git commit`, `git status`, `git log`
- Make your first commit — on purpose, so you see exactly what it does

THE CORE LOOP

```
$ git init           # start tracking this folder
$ git status        # see what has changed
$ git add .         # stage your changes
$ git commit -m "My first commit"
$ git log           # view your commit history
```

Day 2 Checkpoint

Run `git log` and share a screenshot showing your first commit message.
